

Deposit and withdrawal of funds in online casinos.

In any online [site](#) casino, you can play "for candy wrappers", choose only the option "practice" or "for fun" and you can play with minimal registration. If you want to play for real money, you will have to register, indicate your first and last name, full address, e-mail and, preferably, telephone. Provide only real data, otherwise you may have serious problems with receiving the prize! Either you choose yourself, or you are assigned a login and password, take care of them no worse than the PIN code of your credit card, because in the casino you will also keep money.

There is a special section for depositing and withdrawing money - cashier, bank. Now casinos offer various methods of depositing and withdrawing funds, there may be more than a dozen of them, but there is no point in talking about all of them, I will only talk about the most popular and useful ones. There are three of them, WebMoney is a domestic electronic payment system, recommended for those who already use it and plan to play only in Russian and Russified casinos. Moneybookers is an international (British) payment system, recommended for those who want to play in various western casinos, it is accepted in almost all casinos. Bank cards are accepted almost everywhere, but withdrawals are not available everywhere, it is recommended for those who have a card of the required class. Now a little more detail.

WebMoney

WebMoney is the main electronic payment system of the Russian Internet. Any user can register in the system, put money in the "WebMoney wallet" and easily make deposits in the casino. You can work both through the web interface and through a downloadable module. When registering, the user receives a unique WM-identifier and password by which to access the system, and special key files are created on the user's computer, which are also necessary for access (do not provide key files and password to anyone!). The user gets at his disposal several wallets - one for each of the currencies. The wallet number consists of a letter defining the currency and 12 digits. Currently, WebMoney supports wallets in several currencies - rubles, euros, dollars, hryvnia. If necessary, currencies can be converted on a special exchange. You can replenish the WebMoney wallet by bank transfer, using a special payment card, having received money from another participant or through exchange offices that are in almost every city (all the details are on the system's website, the commission will depend on the chosen method). Withdrawing money is possible in the same ways, except for payment cards. Any transfer of money within the system entails a 0.8% commission, including a deposit at a casino. A casino deposit is usually made through a specially opened web form. WebMoney is the standard means of payment in any domestic online store or casino. Recently, more and more Western online casinos are turning their eyes to our market and introducing WebMoney; many major bookmakers / casinos / poker rooms have them. Payments via WebMoney are safe, fast and convenient. Plus - the ability to quickly cash out through exchange offices or a little slower - through a transfer to the bank. The downside is the high transfer and cash overhead, especially if you transfer money frequently.
